Abstract

© 2016, Springer Science+Business Media New York. In this study, we have generated a dual expression cassette plasmid DNA (pDNA) construct containing the species-specific horse (*Equus caballus*) codon optimized sequence encoding potent pro-angiogenic vascular endothelial growth factor (VEGF164) and basic fibroblast growth factor (FGF2) under eukaryotic promoters (EF-1 α and CMV promoters, respectively). We have demonstrated effective and simultaneous recombinant proteins expression in vitro. Resulting pDNA is suitable for potential gene therapy applications in horses.
