## Abstract

Dihalogenobis(triphenylphosphine)palladium(II) complexes 1,  $\text{PdX}_2(\text{PPh}_3)_2$  ( $X = \text{Cl, Br, I}$ ), reacts reversibly with saturated and aromatic hydrocarbons RH (RH = p-xylene, toluene, benzene, n-hexane, cyclohexane), slowly at ambient temperature and rapidly on heating at 70-130°C, to produce hydridodihalogeno(organo)bis(triphenylphosphine)-palladium(IV) complexes 2,  $\text{Pd}(\text{H})(\text{R})\text{X}_2(\text{PPh}_3)_2$ ; in the presence of bases complexes 2 eliminate hydrogen halide forming organobis(triphenylphosphine)palladium(II) halide 3,  $\text{Pd}(\text{R})\text{X}(\text{PPh}_3)_2$ .
