### Abstract

Reaction of the potassium salt of N-diisopropoxyphosphinyl-p- bromothiobenzamide p-BrC<sub>6</sub>H<sub>4</sub>C(S)NHP(O)(O*i*Pr)<sub>2</sub> (HL) with Ni(NO<sub>3</sub>)<sub>2</sub> in aqueous EtOH leads to complex of formula [Ni(HL-O)<sub>2</sub>(L-O,S)<sub>2</sub>] (1). The structure of 1 was investigated by single crystal X-ray diffraction analysis, IR, <sup>1</sup>H and <sup>31</sup>P{<sup>1</sup>H} NMR spectroscopy, MALDI and microanalysis. The nickel(II) ion in 1 has a tetragonal-bipyramidal environment, (O ax)<sub>2</sub>(Oeq)<sub>2</sub>(Seq) 2, with two neutral ligand molecules coordinated in axial positions through the oxygen atoms of the P=O groups. The equatorial plane of bipyramide is formed by two anionic ligands involving 1,5-O,S-coordination mode. The chelating ligands are bound in trans configuration. © 2008 Wiley-VCH Verlag GmbH & Co.
