### Abstract

© 2017 American Physical Society. We review the features of the charge density wave (CDW) conductor NbS<sub>3</sub> (phase II) and include several additional results from transport, compositional, and structural studies. Particularly, we highlight three central results: (1) In addition to the previously reported CDW transitions at TP<sub>1</sub>=360K and TP<sub>2</sub>=150K, a third CDW transition occurs at a much higher temperature TP<sub>0</sub>≈620-650K; evidence for the nonlinear conductivity of this CDW is presented. (2) We show that the CDW associated with the TP<sub>2</sub> transition arises from S vacancies acting as donors. Such a CDW transition has not been observed before. (3) We demonstrate the exceptional coherence of the TP<sub>1</sub> CDW at room temperature. The effects of uniaxial strain on the CDW transition temperature and transport are reported.
