Abstract

© 2018 Wiley-VCH Verlag GmbH & Co. KGaA, Weinheim Radiolabeled biomolecules with short half-life times are of increasing importance for positron emission tomography (PET) imaging studies. Herein, we demonstrate an improved and generalized method for synthesizing a [radiometal]-unsaturated aldehyde as a lysine-labeling probe that can be easily conjugated into various biomolecules through the RIKEN click reaction. As a case study, ⁶⁸Ga-PET imaging of U87MG xenografted mice is demonstrated by using the ⁶⁸Ga-DOTA-RGDyK peptide, which is selective to $\alpha V\beta 3$ integrins.
