

Atmospheric moisture content variability from GPS-GLONASS data near the Kazan city

Kazan Federal University, 420008, Kremlevskaya 18, Kazan, Russia

Abstract

© 2018 Space Research Institute of the Russian Academy of Sciences. All rights reserved. Using the GPS-GLONASS signals, the characteristics of time series of the integrated water vapor in the Kazan city area were determined. The annual amplitude of integrated water vapor is 10.2 mm of precipitated water. The main contribution, up to 63 % to the integrated water vapor variations dispersion, is provided by seasonal variations; mesoscale processes provide about 7 %, synoptic processes - 22 %, the linear trend — less than 1 %. Wavelet analysis of the integrated water vapor series for 2009-2015 showed, that the intensity of synoptic and mesoscale variations for all the investigated parameters is modulated by the annual variation harmonics, with the maximum of the variability observed in the summer period. The interannual variability is found both in synoptic and mesoscale variations of the integrated moisture content.
